CHAPTER 1
PLANNING

This document will guide you through best practices to deploy AMP for Endpoints for the first time. Following this strategy will increase your chances of a successful AMP for Endpoints deployment and evaluation.

Before deployment you should gather as much information as possible about the environment to reduce post-install troubleshooting. To have an effective roll out of the AMP for Endpoints Connector for Windows, you must first identify your environment. To do that you must answer the following questions:

- How many computers is the AMP for Endpoints Connector for Windows being installed on?
- Which operating systems are the computers running?
- What are the hardware specifications for the computers?
- Do the operating systems and specifications meet the minimum requirements for the AMP for Endpoints Connector for Windows?
- Which applications are installed on the computers?
- Which custom applications or not widely deployed applications are installed on the computers?
- Do the computers connect to the Internet through a proxy?
- Will the AMP for Endpoints Connector be deployed on any Windows servers?
- What tool is being used to push software out to the endpoints?
- What security products (AV, HIDS, etc.) are installed on the computers?
- Do you want your users to see the AMP for Endpoints Connector user interface, desktop icon, program group and/or right-click menu?

Once you identify the environment you’re working with then you can apply your first best practice of identifying candidates for an Alpha release. The best way to choose your candidates for Alpha is to choose a combination of three computers per operating system, three computers per custom application, three computers per proxy server, one computer per security product, and one computer per department. Your
Alpha release should probably contain a cross-section of approximately 100 computers.

System requirements and supported operating systems

The following are the minimum system requirements for the AMP for Endpoints Connector based on the operating system. Operating systems not listed here are not currently supported.

AMP for Endpoints Windows Connector

The AMP for Endpoints Windows Connector supports both 32-bit and 64-bit versions of these operating systems.

Currently Supported Versions

**Microsoft Windows 7**
- 1 GHz or faster processor
- 1 GB RAM
- 650 MB available hard disk space - Cloud-only mode
- 1 GB available hard disk space - TETRA

**Microsoft Windows 8 and 8.1 (requires AMP for Endpoints Connector 3.1.4 or later)**
- 1 GHz or faster processor
- 512 MB RAM
- 650 MB available hard disk space - Cloud-only mode
- 1 GB available hard disk space - TETRA

**Microsoft Windows 10 (requires AMP for Endpoints Connector 4.3.0 or later)**
- 1 GHz or faster processor
- 1 GB RAM (32-bit) or 2 GB RAM (64-bit)
- 650 MB available hard disk space - Cloud-only mode
- 1 GB available hard disk space - TETRA

**Microsoft Windows Server 2008 R2**
- 2 GHz or faster processor
- 2 GB RAM
- 650 MB available hard disk space - Cloud only mode
- 1 GB available hard disk space - TETRA

**Microsoft Windows Server 2012 (requires AMP for Endpoints Connector 3.1.9 or later)**
- 2 GHz or faster processor
- 2 GB RAM
- 650 MB available hard disk space - Cloud only mode
- 1 GB available hard disk space - TETRA
Incompatible software and configurations
The AMP for Endpoints Windows Connector is currently not compatible with the following software:

- ZoneAlarm by Check Point
- Carbon Black
- Res Software AppGuard

The AMP for Endpoints Connector does not currently support the following proxy configurations:

- Websense NTLM credential caching. The currently supported workaround for AMP for Endpoints is either to disable NTLM credential caching in Websense or allow the AMP for Endpoints Connector to bypass proxy authentication through the use of authentication exceptions.
- HTTPS content inspection. The currently supported workaround is either to disable HTTPS content inspection or set up exclusions for the AMP for Endpoints Connector.
- Kerberos / GSSAPI authentication. The currently supported workaround is to use either Basic or NTLM authentication.

AMP for Endpoints Mac Connector
The following are the minimum system requirements for the AMP for Endpoints Mac Connector based on the operating system. The AMP for Endpoints Mac Connector only supports 64-bit Macs.

**Apple macOS 10.12 (requires AMP for Endpoints Mac Connector 1.2.4 or later)**
- 2 GB RAM
- 1.5 GB available hard disk space

**Apple macOS 10.13 (requires AMP for Endpoints Mac Connector 1.5.0 or later)**
- 2 GB RAM
- 1.5 GB available hard disk space

**Apple macOS 10.14 (requires AMP for Endpoints Mac Connector 1.9.0 or later)**
- 2 GB RAM
- 1.5 GB available hard disk space

Previously Supported Versions

**Apple OS X 10.7 (requires AMP for Endpoints Mac Connector 1.2.6 or earlier)**
- 2 GB RAM
- 65 MB available hard disk space

**Apple OS X 10.8 (requires AMP for Endpoints Mac Connector 1.3.1 or earlier)**
- 2 GB RAM
- 65 MB available hard disk space

**Apple OS X 10.9 (requires AMP for Endpoints Mac Connector 1.4.3 or earlier)**
- 2 GB RAM
- 65 MB available hard disk space
Planning
System requirements and supported operating systems

Apple OS X 10.10 (requires AMP for Endpoints Mac Connector 1.5.1 or earlier)
- 2 GB RAM
- 65 MB available hard disk space

Apple OS X 10.11 (requires AMP for Endpoints Mac Connector 1.0.7 to 1.8.1)
- 2 GB RAM
- 1.5 GB available hard disk space

Incompatible Software and Configurations
The AMP for Endpoints Mac Connector does not currently support the following proxy configurations:
- Websense NTLM credential caching: The currently supported workaround for AMP for Endpoints is either to disable NTLM credential caching in Websense or allow the AMP for Endpoints Connector to bypass proxy authentication through the use of authentication exceptions.
- HTTPS content inspection: The currently supported workaround is either to disable HTTPS content inspection or set up exclusions for the AMP for Endpoints Connector.
- Kerberos / GSSAPI authentication: The currently supported workaround is to use either Basic or NTLM authentication.

AMP for Endpoints Linux Connector
The following are the minimum system requirements for the AMP for Endpoints Linux Connector based on the operating system. The AMP for Endpoints Linux Connector only supports x64 architectures.

RHEL/CentOS 6.9 (requires AMP for Endpoints Linux Connector 1.5.1 or later)
- 2 GB RAM
- 1.5 GB available hard disk space

RHEL/CentOS 6.10 (requires AMP for Endpoints Linux Connector 1.9.0 or later)
- 2 GB RAM
- 1.5 GB available hard disk space

RHEL/CentOS 7.4 (requires AMP for Endpoints Linux Connector 1.5.1 or later)
- 2 GB RAM
- 1.5 GB available hard disk space

RHEL/CentOS 7.5 (requires AMP for Endpoints Linux Connector 1.8.0 or later)
- 2 GB RAM
- 1.5 GB available hard disk space

IMPORTANT! The AMP for Endpoints Linux Connector may not install properly on custom kernels. If you have a custom kernel, contact Support before attempting to install.
Previously Supported Versions

**RHEL/CentOS 6.5/6.6/6.7 (requires AMP for Endpoints Linux Connector 1.6.0 or earlier)**
- 1 GB RAM
- 400 MB available hard disk space

**RHEL/CentOS 6.8 (requires AMP for Endpoints Linux Connector 1.2.1 or later)**
- 1 GB RAM
- 1.5 GB available hard disk space

**RHEL/CentOS 7.2 (requires AMP for Endpoints Linux Connector 1.6.0 or earlier)**
- 1 GB RAM
- 400 MB available hard disk space

**RHEL/CentOS 7.3 (requires AMP for Endpoints Linux Connector 1.3.0 or later)**
- 1 GB RAM
- 1.5 GB available hard disk space

The AMP for Endpoints Linux Connector may not install properly on custom kernels. If you have a custom kernel, contact Support before attempting to install.

Incompatible software and configurations

The AMP for Endpoints Linux Connector is currently not compatible with the following software:
- F-Secure Linux Security
- Kaspersky Endpoint Security
- McAfee VSE for Linux
- McAfee Endpoint Security for Linux
- Sophos Server Security 9
- Symantec Endpoint Protection

The AMP for Endpoints Linux Connector may cause unmount failures with removable media or temporary file systems mounted in non-standard locations in Centos and Red Hat Enterprise Linux versions 6.x. In accordance with the File System Hierarchy Standard, removable media such as USB storage, DVDs, and CD-ROMs should be mounted to `/media/` while temporarily mounted file systems such as NFS file system mounts should be mounted to `/mnt/`. Mounting removable media or temporary file systems to other directories can cause a conflict where unmount fails due to device busy. Upon encountering an unmount failure, the user must stop the cisco-amp service, retry the unmount operation, then restart cisco-amp.

```
sudo initctl stop cisco-amp
sudo umount {dir\device}
sudo initctl start cisco-amp
```

The AMP for Endpoints Linux Connector does not support UEFI Secure Boot.

The AMP for Endpoints Linux Connector uses kernel modules that when loaded in Red Hat Enterprise Linux 7.x or CentOS 7.x taints the kernel. To temporarily prevent AMP from influencing kernel taint, the AMP service can be disabled, which prevents these kernel modules being loaded after the system restarts. This procedure should be used
with caution, as disabling the AMP service effectively disables AMP protection on this system. To disable the AMP service, run the commands:

```
sudo systemctl disable cisco-amp
sudo systemctl stop cisco-amp
```

A system restart is required to reload the kernel and reset the kernel taint value. To re-enable the AMP service, run the commands:

```
sudo systemctl enable cisco-amp
sudo systemctl start cisco-amp
```

### Cisco Security Connector

The following are the minimum system requirements for the Cisco Security Connector:

- iOS device running iOS version 11.3 or higher.
- The device must be running in supervised mode and managed using a Mobile Device Manager (MDM) and Device Enrollment Program (DEP) and Volume Purchase Program (VPP).
- 5 MB free space.

You will also have to set up MDM Integration between the AMP Console and one of the following Mobile Device Managers:

- Meraki System Manager (SM) with API access enabled.
  - Only System Manager and Combined network types are supported.
- MobileIron Enterprise Mobility Management (EMM) On-Prem 9.4 or higher.
- AirWatch Mobility Management Cloud 9.2 or higher.

### Gather information about endpoint security

Conflicts can arise when multiple security applications are running on a single computer. To prevent conflicts between applications you will need to create exclusions for AMP for Endpoints in other security apps and exclude the security apps from AMP for Endpoints.

First, find out how many security applications are installed. Do different groups in the organization use different products? Find out the install, update, data, and quarantine path for each security product installed and make a note of it.

Next, decide on the install path for the AMP for Endpoints Connector (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher). You will need to exclude the AMP for Endpoints Connector directory from the other security applications, particularly antivirus products.
Create exclusions for AMP for Endpoints in other security products

Creating Exclusions in McAfee Products

**ePolicy Orchestrator 4.6**

1. Log in to ePolicy Orchestrator.
2. Select Policy > Policy Catalog from the Menu.
3. Select the appropriate version of VirusScan Enterprise from the Product pulldown.
5. Select the Exclusions tab click the Add button.
6. In the By Pattern field enter the path to your AMP for Endpoints Connector install (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and check the Also exclude subfolders box.
7. Click OK.
8. Click Save.
10. Repeat steps 5 through 8 for this policy.

**VirusScan Enterprise 8.8**

1. Open the VirusScan Console.
3. Select All Processes from the left pane.
4. Select the Exclusions tab.
5. Click the Exclusions button.
6. On the Set Exclusions dialog click the Add button.
7. Click the Browse button and select your AMP for Endpoints Connector install directory (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and check the Also exclude subfolders box.
8. Click OK.
9. Click OK on the Set Exclusions dialog.
Creating Exclusions in Symantec Products

Managed Symantec Enterprise Protection 12.1

1. Log into Symantec Endpoint Protection Manager.
2. Click Policies in the left pane.
3. Select the Exceptions entry under the Policies list.
4. You can either add a new Exceptions Policy or edit an existing one.
5. Click Exceptions once you have opened the policy.
6. Click the Add button, select Windows Exceptions from the list and choose Folder from the submenu.
7. In the Add Security Risk Folder Exception dialog choose [PROGRAM_FILES] from the Prefix variable dropdown menu and enter Cisco in the Folder field. Ensure that Include subfolders is checked.
8. Under Specify the type of scan that excludes this folder menu select All.
9. Click OK.
10. Make sure that this Exception is used by all computers in your organization with the AMP for Endpoints Connector installed.

Unmanaged Symantec Enterprise Protection 12.1

1. Open SEP and click on Change Settings in the left pane.
2. Click Configure Settings next to the Exceptions entry.
3. Click the Add button on the Exceptions dialog.
4. Select Folders from the Security Risk Exception submenu.
5. Select your AMP for Endpoints Connector installation folder (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) from the dialog and click OK.
6. Click the Add button on the Exceptions dialog.
7. Select Folder from the SONAR Exception submenu.
8. Select your AMP for Endpoints Connector installation folder (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) from the dialog and click OK.
9. Click the Close button.

Creating Exclusions in Microsoft Security Essentials

1. Open Microsoft Security Essentials and click on the Settings tab.
2. Select Excluded files and locations in the left pane.
3. Click the Browse button and navigate to your AMP for Endpoints Connector installation folder (C:\Program Files\Sourcefire by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and click OK.

4. Click the Add button then click Save changes.

5. Select Excluded processes in the left pane.

6. Click the Browse button and navigate to the sfc.exe or agent.exe file (C:\Program Files\Sourcefire\FireAMP\x.x.x\sfc.exe by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP\x.x.x\sfc.exe for versions 5.1.1 and higher) and where x.x.x is the AMP for Endpoints Connector version number) and click OK.

7. Click the Add button then click Save changes.

---

**IMPORTANT!** Because the process exclusions in Microsoft Security Essentials require a specific path to the sfc.exe file you will need to update this exclusion whenever you upgrade to a new version of the AMP for Endpoints Connector.

---

**Gather information about custom apps**

Custom applications can present a problem for initial deployment. Most widely-used applications have already been marked as clean files in the AMP for Endpoints Cloud and tested with the AMP for Endpoints Connector. Custom applications are less likely to have this benefit, so extra precautions need to be taken with them. Find out if there are any custom or legacy applications running and the install path for each one and make a note of it. If only certain groups of users have the application installed, note which users they are. If the custom application has separate information stores, note the file path of those as well.

If possible, use a program like md5deep to calculate the SHA-256 value of the custom application's executable files.

**Gather information about proxy servers**

If the computers in the organization use a proxy server to connect to the Internet you will need to gather some information about it including:

- Proxy host name
- Proxy port
- Type of proxy
- User name and password for authentication (if required)
- PAC file URL if they are used
- Whether the proxy server is used for DNS resolution
- If the proxy server will allow communications via TCP port 32137

**Check firewall rules**

To allow the AMP for Endpoints Connector to communicate with Cisco systems, the firewall must allow the clients to connect to certain servers over specific ports. There
are three sets of servers depending on where you are located – one for the European Union, one for Asia Pacific, Japan, and Greater China, and one for the rest of the world.

**IMPORTANT!** If your firewall requires IP address exceptions see this Cisco TechNote.

## AMP for Endpoints Windows Firewall Exceptions

### North America

Organizations located in North America must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com
- **Management Server** - mgmt.amp.cisco.com
- **Policy Server** - policy.amp.cisco.com
- **Error Reporting** - crash.amp.cisco.com
- **Endpoint IOC Downloads** - ioc.amp.cisco.com
- **Advanced Custom Signatures** - custom-signatures.amp.cisco.com
- **Connector Upgrades** - upgrades.amp.cisco.com (TCP 80 and 443)
- **Remote File Fetch** - rff.amp.cisco.com

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups the firewall must allow the clients to connect to the following server over TCP 443:

- **Cloud Host** - cloud-ec.amp.cisco.com

For AMP for Endpoints Windows version 5.0 and higher you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:

- **Cloud Host** - cloud-ec-asn.amp.cisco.com
- **Enrollment Server** - cloud-ec-est.amp.cisco.com

If you have TETRA enabled on any of your AMP for Endpoints Connectors you must allow access to the following server over TCP 80 and 443 for signature updates:

- **Update Server** - tetra-defs.amp.cisco.com

### European Union

Organizations located in the European Union must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.eu.amp.cisco.com
- **Management Server** - mgmt.eu.amp.cisco.com
- **Policy Server** - policy.eu.amp.cisco.com
- **Error Reporting** - crash.eu.amp.cisco.com
- **Endpoint IOC Downloads** - ioc.eu.amp.cisco.com
- **Advanced Custom Signatures** - custom-signatures.eu.amp.cisco.com
- **Connector Upgrades** - upgrades.eu.amp.cisco.com (TCP 80 and 443)
- **Remote File Fetch** - rff.eu.amp.cisco.com
Planning
Check firewall rules

Chapter 1

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups the firewall must allow the clients to connect to the following server over TCP 443 by default or TCP 32137:

- **Cloud Host** - cloud-ec.eu.amp.cisco.com

For AMP for Endpoints Windows version 5.0 and higher, you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:

- **Cloud Host** - cloud-ec-asn.eu.amp.cisco.com
- **Enrollment Server** - cloud-ec-est.eu.amp.cisco.com

If you have TETRA enabled on any of your AMP for Endpoints Connectors, you must allow access to the following server over TCP 80 and 443 for signature updates:

- **Update Server** - tetra-defs.eu.amp.cisco.com

Asia Pacific, Japan, and Greater China

Organizations located in the Asia Pacific, Japan, and Greater China region must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.apjc.amp.cisco.com
- **Management Server** - mgmt.apjc.amp.cisco.com
- **Policy Server** - policy.apjc.amp.cisco.com
- **Error Reporting** - crash.apjc.amp.cisco.com
- **Endpoint IOC Downloads** - ioc.apjc.amp.cisco.com
- **Advanced Custom Signatures** - custom-signatures.apjc.amp.cisco.com
- **Connector Upgrades** - upgrades.apjc.amp.cisco.com (TCP 80 and 443)
- **Remote File Fetch** - rff.apjc.amp.cisco.com

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups, the firewall must allow the clients to connect to the following server over TCP 443 by default or TCP 32137:

- **Cloud Host** - cloud-ec.apjc.amp.cisco.com

For AMP for Endpoints Windows version 5.0 and higher, you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:

- **Cloud Host** - cloud-ec-ASN.apjc.amp.cisco.com
- **Enrollment Server** - cloud-ec-EST.apjc.amp.cisco.com

If you have TETRA enabled on any of your AMP for Endpoints Connectors, you must allow access to the following server over TCP 80 and 443 for signature updates:

- **Update Server** - tetra-defs.apjc.amp.cisco.com

AMP for Endpoints Mac Firewall Exceptions

North America

Organizations located in North America must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com
- **Management Server** - mgmt.amp.cisco.com
- **Policy Server** - policy.amp.cisco.com
Planning
Check firewall rules

• **Error Reporting** - crash.amp.cisco.com
• **Connector Upgrades** - upgrades.amp.cisco.com (TCP 80 and 443)
• **Remote File Fetch** - rff.amp.cisco.com

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups, the firewall must allow the clients to connect to the following server over TCP 443 by default or TCP 32137:
  • **Cloud Host** - cloud-ec.amp.cisco.com

For AMP for Endpoints Mac version 1.2 and higher, you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:
  • **Cloud Host** - cloud-ec-asn.amp.cisco.com
  • **Enrollment Server** - cloud-ec-est.amp.cisco.com

If you have ClamAV enabled on any of your AMP for Endpoints Mac Connectors you must allow access to the following server over TCP 80 for signature updates:
  • **Update Server** - clam-defs.amp.cisco.com

**European Union**
Organizations located in the European Union must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):
  • **Event Server** - intake.eu.amp.cisco.com
  • **Management Server** - mgmt.eu.amp.cisco.com
  • **Policy Server** - policy.eu.amp.cisco.com
  • **Error Reporting** - crash.eu.amp.cisco.com
  • **Connector Upgrades** - upgrades.eu.amp.cisco.com (TCP 80 and 443)
  • **Remote File Fetch** - rff.eu.amp.cisco.com

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups, the firewall must allow the clients to connect to the following server over TCP 443 by default or TCP 32137:
  • **Cloud Host** - cloud-ec.eu.amp.cisco.com

For AMP for Endpoints Mac version 1.2 and higher, you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:
  • **Cloud Host** - cloud-ec-asn.eu.amp.cisco.com
  • **Enrollment Server** - cloud-ec-est.eu.amp.cisco.com

If you have ClamAV enabled on any of your AMP for Endpoints Mac Connectors, you must allow access to the following server over TCP 80 for signature updates:
  • **Update Server** - clam-defs.eu.amp.cisco.com

**Asia Pacific, Japan, and Greater China**
Organizations located in the Asia Pacific, Japan and Greater China region must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):
  • **Event Server** - intake.apjc.amp.cisco.com
  • **Management Server** - mgmt.apjc.amp.cisco.com
  • **Policy Server** - policy.apjc.amp.cisco.com
  • **Error Reporting** - crash.apjc.amp.cisco.com
To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups, the firewall must allow the clients to connect to the following server over TCP 443 by default or TCP 32137:

- **Cloud Host** - cloud-ec.apjc.amp.cisco.com

For AMP for Endpoints Mac version 1.2 and higher, you will need to use the following Cloud Host address and enrollment server (both TCP 443) instead:

- **Cloud Host** - cloud-ec-asn.apjc.amp.cisco.com
- **Enrollment Server** - cloud-ec-est.apjc.amp.cisco.com

If you have ClamAV enabled on any of your AMP for Endpoints Mac Connectors, you must allow access to the following server over TCP 80 for signature updates:

- **Update Server** - clam-defs.apjc.amp.cisco.com

## AMP for Endpoints Linux Firewall Exceptions

### North America

Organizations located in North America must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com
- **Management Server** - mgmt.amp.cisco.com
- **Policy Server** - policy.amp.cisco.com
- **Error Reporting** - crash.amp.cisco.com
- **Connector Upgrades** - upgrades.amp.cisco.com (TCP 80 and 443)

To allow the Connector to communicate with Cisco cloud servers for file and network disposition lookups, the firewall must allow the clients to connect to the following servers over TCP 443:

- **Cloud Host** - cloud-ec-asn.amp.cisco.com
- **Enrollment Server** - cloud-ec-est.amp.cisco.com

If you have ClamAV enabled on any of your AMP for Endpoints Linux Connectors, you must allow access to the following server over TCP 80 for signature updates:

- **Enrollment Server** - cloud-ec-est.apjc.amp.cisco.com

If you have ClamAV enabled on any of your AMP for Endpoints Linux Connectors you must allow access to the following server over TCP 80 for signature updates:

**Update Server** - clam-defs.apjc.amp.cisco.com

**Cisco Security Connector Firewall Exceptions**

**North America**

Organizations located in North America must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com/event/
- **Management Server** - mgmt.amp.cisco.com/agent/v1/
- **Cloud Host** - cloud-ios-asn.amp.cisco.com
- **Enrollment Server** - cloud-ios-est.amp.cisco.com

**European Union Firewall Exceptions**

Organizations located in the European Union must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com/event/
- **Management Server** - mgmt.amp.cisco.com/agent/v1/
- **Cloud Host** - cloud-ios-asn.eu.amp.cisco.com
- **Enrollment Server** - cloud-ios-est.eu.amp.cisco.com
Asia Pacific, Japan, and Greater China Firewall Exceptions

Organizations located in the Asia Pacific, Japan, and Greater China region must allow connectivity from the Connector to the following servers over HTTPS (TCP 443):

- **Event Server** - intake.amp.cisco.com/event/
- **Management Server** - mgmt.amp.cisco.com/agent/v1/
- **Cloud Host** - cloud-ios-asn.apjc.amp.cisco.com
- **Enrollment Server** - cloud-ios-est.apjc.amp.cisco.com

Selecting computers for evaluation deployment

Instead of installing the AMP for Endpoints Connector on a single computer, select a representative cross section of different users. If different operating systems and application sets are in use, try to deploy on at least one of each image type.
Before deploying AMP for Endpoints Connectors there are tasks to complete in the AMP for Endpoints portal based on the information you gathered.

Create exclusions

To prevent conflicts between the AMP for Endpoints Connector and antivirus or other security software, you must create exclusions so that the Connector doesn’t scan your antivirus directory and your antivirus doesn’t scan the Connector directory. This can create problems if antivirus signatures contain strings that the Connector sees as malicious or cause issues with quarantined files.

The first step is to create an exclusion by navigating to Management > Exclusions in the AMP for Endpoints Console.
Click on **Create Exclusion Set** to create a new list of exclusions. Enter a name for the list – for example, Desktop Exclusions – and click **Create**.

Next click **Add Exclusion** to add an exclusion to your list.

You will then be prompted to select an exclusion type. You can add a path, threat name, file extension, process, or use wild cards for file names, extensions, or paths. Select **Path** and enter the CSIDL of the security products you have installed on your endpoints then click **Create**.

**IMPORTANT!** You do not need to escape “space” characters in a path. For some non-English languages, different characters may represent path separators. The Connectors will only recognize ‘\’ characters as valid path separators for exclusions to take effect.

Repeat this procedure for each path associated with your security applications. More information about CSIDLs can be found [here](#). Common CSIDLs are:
Create outbreak control lists

During the early stages of deployment you may encounter previously unseen malware on computers as well as false-positive detection of custom applications. To make sure the AMP for Endpoints Connector deals with these properly, you will want to create a Simple Custom Detection list and a Custom Whitelist to associate with your policies.

To create a Simple Custom Detection list, go to Outbreak Control > Simple. Click Create to create a new Simple Custom Detection, name it Quick SCD (or a name that you prefer), and click on Save.
Portal Configuration

Create policies

To create a Custom Whitelist, go to Outbreak Control > Whitelisting. Next click Create to create a new Custom Whitelist, name it Quick WL (or a name that you prefer), and click Save.

Create policies

For initial deployment we recommend you go to Management > Groups and create the following policies with specific configurations:

Audit Only
This policy puts the AMP for Endpoints Connector in a mode that will only detect malicious files but not quarantine them. Malicious network traffic is also detected but not blocked.

- This policy uses all the default policy settings but with Modes and Engines > Files set to Audit.
- The proxy server information gathered previously should be entered under Proxy.
- Associate the exclusion set you previously created with this policy.
- Associate the Quick SCD list you created with this policy.
- Associate the Quick WL list you created with this policy.

Protect
This is the standard policy for the AMP for Endpoints Connector that will quarantine malicious files and block malicious network connections. Once you have become familiar with the way the AMP for Endpoints Connector behaves you can tweak this policy to your own preferences.

- This policy uses all the default policy settings but with the Modes and Engines > TETRA unchecked.
- The proxy server information gathered previously should be entered under Proxy.
- Associate the exclusion set you previously created with this policy.
- Associate the Quick SCD list you created with this policy.
- Associate the Quick WL list you created with this policy.

Triage
This is an aggressive policy that enables the offline engine to scan computers that are suspected or known to be infected with malware.

- This policy uses all the default policy settings but with Modes and Engines > TETRA checked and with Modes and Engines > Network set to Block.

IMPORTANT! If you enable TETRA you should never use this policy on an endpoint that already has another antivirus product installed.

- The proxy server information gathered previously should be entered under Proxy.
• Associate the exclusion set you previously created with this policy.
• Associate the Quick SCD list you created with this policy.
• Associate the Quick WL list you created with this policy.

Server
This is a lightweight policy for high availability computers and servers that require maximum performance and uptime.

• This policy uses all the default policy settings but with Modes and Engines > Files set to Audit.
• You can enable Modes and Engines > TETRA on your Server policy but it is highly recommended that you deploy it to a test server before rolling the policy out to your production servers. We also recommend using a local AMP Update Server for your TETRA definition updates.

**WARNING!** Running TETRA on a server without testing and proper Exclusions could significantly impact performance.

• If you do not want to run TETRA on your servers due to performance concerns you must make sure that Modes and Engines > TETRA is unchecked.

**WARNING!** When installing the AMP for Endpoints Connector on a server without TETRA you must also use the /skiptetra command line switch along with this policy setting.

• If your servers host services or applications that require a large number of network connections (SMB, SQL, Exchange, etc.) it is recommended that Modes and Engines > Network be set to Disabled.

**WARNING!** When installing the AMP for Endpoints Connector on a server you must also use the /skipdfc command line switch along with this policy setting.

• The proxy server information gathered previously should be entered under Proxy.
• Associate the server exclusion set you previously created with this policy.
• Associate the Quick SCD list you created with this policy.
• Associate the Quick WL list you created with this policy.
Domain Controller

This is a lightweight policy for use on Active Directory Domain Controllers.

- This policy uses all the default policy settings but with the **Modes and Engines > Files** set to **Audit**.
- Because of authentication traffic from your network it is recommended that **Modes and Engines > Network** be set to **Disabled**.

**WARNING!** When installing the AMP for Endpoints Connector on a domain controller you must also use the `/skipdfc` command line switch along with this policy setting.

- If your servers are running Windows 2008 you must make sure that **Modes and Engines > TETRA** is unchecked.

**WARNING!** When installing the AMP for Endpoints Connector on a domain controller you must also use the `/skiptetra` command line switch along with this policy setting.

- The proxy server information gathered previously should be entered under **Proxy**.
- Associate the domain controller exclusion set you previously created with this policy.
- Associate the Quick SCD list you created with this policy.
- Associate the Quick WL list you created with this policy.

**IMPORTANT!** If you have computers in multiple geographic locations using different proxy servers you will need to create the above policies for each location ie. Audit Only NYC and Audit Only London.

Create groups

Now that you have created the initial policies for your deployment you need to create groups to associate the policies with. Go to Management -> Groups and create the following groups:

Audit Only

- Associate this group with the Audit Only policy.
- This should be the first group that the workstations in your deployment belong to so that you can root out any false positive detections without the files being quarantined.
- You can also use the Audit Only group as a performance group for computers that require higher availability or perform intensive tasks like rendering graphics.
Create whitelist from gold master

If you have a gold master image available it is advisable to use it to whitelist applications. You can use a tool like `md5deep` to generate SHA-256 values for all the applications and add them to your Quick WL whitelist.

Download installer

Now that you have created your policies and associated them with groups you can begin deploying the AMP for Endpoints Connector to the computers you identified in the information gathering stage. Go to Management > Download Connector and download a redistributable installer for the Audit Only, Triage, Servers, and Domain Controllers groups.

All of your average user computers should initially use the Audit Only installer. This will allow you to make sure that all of the necessary applications have been whitelisted and proper exclusions were created. Any detections will still trigger alerts in the AMP for Endpoints Console but nothing will be quarantined or blocked. This ensures that in the case of a false positive detection that there are no disruptions in regular operations. If you see a false positive detection, add the application in question to your whitelist.
Once you are satisfied with the performance of the AMP for Endpoints Connector you can move computers from the Audit Only group into the Protect group. The Protect group has the same policy settings as the Audit Only group, except that malicious files will be quarantined and connections to malicious websites will be blocked.

Only use the Domain Controllers installer on your Active Directory domain controller servers. The policy for this group includes exclusions that are specific to servers that run directory services for your tree.

Use the Servers installer on all your other servers, such as file, SQL, and Exchange servers.
Now you are ready to begin deploying the AMP for Endpoints Connector to your evaluation computers.

Command line switches

Administrators who have their own deployment software can use command line switches to automate the deployment. Here is a list of available switches:

- /R - For all Connector versions 5.1.13 and higher this must be the first switch used.
- /S - Used to put the installer into silent mode.

**IMPORTANT!** This must be specified as the first parameter or the parameter immediately after /R.

- /desktopicon 0 - A desktop icon for the Connector will not be created.
- /desktopicon 1 - A desktop icon for the Connector will be created.
- /startmenu 0 - Start Menu shortcuts are not created.
- /startmenu 1 - Start Menu shortcuts are created.
- /contextmenu 0 - Disables Scan Now from the right-click context menu.
- /contextmenu 1 - Enables Scan Now in the right-click context menu.
- /remove 0 - Uninstalls the Connector but leaves files behind useful for reinstalling later.
- /remove 1 - Uninstalls the Connector and removes all associated files.
- /uninstallpassword [Connector Protection Password] - Allows you to uninstall the Connector when you have **Connector Protection** enabled in your policy. You must supply the **Connector Protection** password with this switch.
Deploying the AMP for Endpoints Connector

Command line switches

Chapter 3

- `/skipdfc 1` - Skip installation of the DFC driver.

  **IMPORTANT!** Any Connectors installed using this flag must be in a group with a policy that has **Modes and Engines > Network** set to **Disabled**.

- `/skiptetra 1` - Skip installation of the TETRA driver.

  **IMPORTANT!** Any Connectors installed using this flag must be in a group with a policy that has **Modes and Engines > TETRA** unchecked.

- `/D=[PATH]` - Used to specify which directory to perform the install. For example `/D=C:\tmp` will install into C:\tmp.

  **IMPORTANT!** This must be specified as the last parameter.

- `/overridepolicy 1` - Replace existing policy.xml file when installing over a previous Connector install.
- `/overridepolicy 0` - Do not replace existing policy.xml file when installing over a previous Connector install.
- `/temppath` - Used to specify the path to use for temporary files created during Connector install. For example, `/temppath C:\somepath\temporaryfolder`. This switch is only available in the AMP for Endpoints Windows Connector 5.0 and higher.

Running the command line installer without specifying any switches is equivalent to

`/desktopicon 0 /startmenu 1 /contextmenu 1 /skipdfc 0 /skiptetra 0`.

There is a command line switch in AMP for Endpoints Windows Connector 5.1.3 and higher to enable users to opt in/out of migrating the install directory from "Sourcefire" to "Cisco" when upgrading from versions prior to 5.1.1 to versions 5.1.3 and higher. These are as follows:

- `/renameinstalldir 1` will change the install directory from Sourcefire to Cisco.
- `/renameinstalldir 0` will not change the install directory.

  **IMPORTANT!** By default `/renameinstalldir 1` will be used.

AMP for Endpoints Windows Connector 6.0.5 and higher has a command line switch to skip the check for Microsoft Security Advisory 3033929.

- `/skipexprevprereqcheck 1` - Skip the check for Microsoft Windows KB3033929.
- `/skipexprevprereqcheck 0` - Check for Microsoft Windows KB3033929 (Default).

  **IMPORTANT!** If you use this switch and do not have this KB installed, or other Windows Updates that enable SHA-2 code signing support for Windows 7 and Windows Server 2008 R2, you will encounter issues connecting to the Cisco Cloud.
Installer exit codes

Administrators who use the command line switches to install the AMP for Endpoints Connector should be aware of the exit codes. They can be found in immpro_install.log in the %TEMP% folder.

- 0 – Success.
- 1500 – Installer already running.
- 1618 – Another installation is already in progress.
- 1633 – Unsupported platform (i.e. installing 32 on 64 and vice versa).
- 1638 – This version or newer version of product already exists.
- 1801 – invalid install path.
- 3010 – Success (Reboot required – will only be used on upgrade).
- 16001 – Your trial install has expired.
- 16002 – A reboot is pending on the user’s computer that must be completed before installing.
- 16003 – Unsupported operating system (i.e. XP SP2, Win2000).
- 16004 – invalid user permissions (not running as admin).
- 16005 – Existing AMP for Endpoints Connector service was already stopped or uses Connector Protection and the password was not supplied.
- 16006 – PoS OS specific features (Enhanced Write Filter (EWF) or File-Based Write Filter (FBWF)) are currently enabled which interfere with the Windows Connector. Disable the features and try again. Note that PoS OSes are not officially supported.
- 16007 – Connector upgrade requires a reboot to complete, but the Block Reboot option has been configured in policy.
- 16008 – Connector upgrade blocked due to pending reboot already required on the computer.
- 16009 – SHA-2 Code signing support for Windows 7 and Windows Server 2008 R2 patch is missing (KB3033929).

Deployment

You can download the installer from Management > Download Connector and make the file available on a file share, use login scripts to install it, or distribute it using enterprise software deployment tools.
Microsoft System Center Configuration Manager

To install the AMP for Endpoints Connector using Microsoft System Center Configuration Manager (SCCM) you will first need to download the redistributable installer for each of your groups.

1. Go to Management > Download Connector and select one of your groups, make sure to check the Create Redistributable Installer box, then click Download. The downloaded file will include the name of the group to make it easily identifiable, for example Protect-FireAMPSetup.exe.

2. Create an AMP for Endpoints folder in the shared source file directory on your SCCM server and copy the installer files to that folder.

3. Next, open your Configuration Manager Console and navigate to Software Library > Overview > Application Management > Applications and click Create Application.

4. On the first screen of the Create Application Wizard, select “Manually specify the application information” and click Next.

5. Enter identifying information for your application package. If you plan to deploy multiple group versions of the AMP for Endpoints Connector it is a good idea to use the group name to easily differentiate them in your software library. When you have entered the necessary information, click Next.
6. Enter the information available to your users in the Application Catalog. When you have entered the necessary information, click Next.

7. On the Deployment Types screen click the Add button to launch the Create Deployment Type wizard.

8. Select “Manually specify the deployment type information” and click Next.
9. Enter the application name and select languages then click Next.
10. Enter the path to the installer files you downloaded for each of your groups in the Content location field. Enter the name of your executable installer file along with any command line switches you want to use in the Installation program field. You can also specify the Uninstall program and path (C:\Program Files\Sourcefire\FireAMP\[version]\uninstall.exe by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP\[version]\uninstall.exe for versions 5.1.1 and higher, where [version] is the Connector version installed (such as 5.1.1). Click Next to continue.

12. Select File System as the Setting Type, then File as the Type. Enter the path to where you plan on installing the AMP for Endpoints Connector on your endpoints (C:\Program Files\Sourcefire\FireAMP\[version] by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP\[version] for versions 5.1.1 and higher, where [version] is the Connector version installed (such as 5.1.1), then enter sfc.exe in the File or folder name field. Click OK, then click Next on the Detection Method page.
13. Select Install for system as the Installation behavior and Only when a user is logged on for the Logon requirement. Select the Installation program visibility setting you want, then check Allow users to view and interact with the program installation. Click Next.

14. You can choose to specify any installation requirements or simply click Next on the Requirements screen.

15. Click Next on the Dependencies screen.

16. Review your settings on the Summary screen and if you are satisfied click Next.

17. Once the wizard has completed successfully click Close to return to the Create Application Wizard. Click Next.

18. Review your settings on the Summary screen and if you are satisfied click Next.

19. Once the wizard has completed successfully click Close.

Your application will now be listed in the Software Library. Deploy the content to your Deployment Point and select whether to deploy it to Users and Groups or Devices.
CHAPTER 4
TROUBLESHOOTING

This section describes some issues that may arise after the AMP for Endpoints Connector is installed and remediation steps.

Initial Configuration Failure

Under rare circumstances the initial configuration of your AMP for Endpoints Private Cloud device may fail. If this occurs you will need to delete the Private Cloud device from your virtual machine console and import the OVA again. If the initial configuration fails again contact Support.

Performance

AMP for Endpoints uses a filter driver to identify file copies, moves, and executes. This may cause additional file latency in some applications that have high I/O such as databases. To reduce latency you may need to determine what should be excluded from AMP for Endpoints:

1. Identify where the application files exist.
2. Determine where the data files are being used.
3. Exclude both of those locations.
4. If there are still issues with the given application, turn on debug logging in the policy for the AMP for Endpoints Connector.
5. Use the logs to determine any temporary files being used.
Another helpful tip is that if you download the latest version of sqlite3 (http://www.sqlite.org/download.html), you can use that to query the history and see files that are continuously being written to, for example:

```bash
sqlite3.exe "C:\Program Files\Cisco\AMP\history.db"
SQLite version 3.7.16.2 2013-04-12 11:52:43
Enter ".help" for instructions
Enter SQL statements terminated with a ";"
sqlite> .headers on
sqlite> select filename, count(filename) from history group by filename order by count(filename) desc limit 10;
filename | count(filename)
\?\C:\WINDOWS\Tasks\User_Feed_Synchronization-{A1489466-0BD4-42D2-A8B6-864FEA527577}.job | 1706
\?\C:\Documents and Settings\Administrator\Local Settings\Application Data\Microsoft\Feeds\{5588ACFD-6436-411B-A5CE-666AE6A92D3D}\Internet Explorer Suggested Sites~.feed-ms | 341
\?\C:\WINDOWS\Tasks\GoogleUpdateTaskUserS-1-5-21-839522115-1229272821-725345543-500UA.job | 222
...
```

The above data identifies some exclusions that may be worth implementing:

- **FilePath:** CSIDL_WINDOWS\Tasks
- **FileExtension:** *.feed-ms

**Outlook performance**

If you notice slow performance in Outlook with the AMP for Endpoints Connector installed, this may be from the high I/O on the .pst or .ost file. In this case, it is best to create an exclusion for all .pst and .ost files in the AMP for Endpoints Console. Go to Management > Exclusions and click Edit for the exclusion set you want. Click Add Exclusion and select File Extension from the Exclusion type drop down menu. Enter .pst in the field and click Create. Repeat this for the .ost file extension if you use Outlook with an Exchange server.

**Cannot connect to the cloud**

There can be any number of reasons why the AMP for Endpoints Connector cannot connect to the cloud. The most common two are that there is a firewall preventing the
Troubleshooting

Copy, move, or execute events not in Device Trajectory

Chapter 4

outbound connection or that the proxy server is not cooperating with the connection. In both cases, you want to start troubleshooting with these steps:

1. Make sure the sfc.exe process (or agent.exe for versions prior to 3.1.4) is running. Open the Task Manager, select Show processes from all users, and make sure there is an sfc.exe process (agent.exe for versions prior to 3.1.4) listed. If it is not, open the command prompt as an administrator and run `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1).

2. Make sure that there is only one iptray.exe process listed in the Task Manager. If there is more than one iptray.exe process you will need to end both iptray.exe processes and restart the Connector user interface.

3. Make sure you can connect to cloud-ec.amp.sourcefire.com over the correct port. A simple telnet test on TCP 443 should suffice if there is no proxy configured. If there is a proxy, see the [Proxy section below](#)

4. If you’re still unable to connect, then uninstall the AMP for Endpoints Connector and reboot the computer. Afterwards go to the policy that you’re using and set Advanced Settings > Administrative Features > Connector Log Level to Debug. Then download the AMP for Endpoints Connector installer and re-install it. This will give additional information to send to diagnose the issue.

Copy, move, or execute events not in Device Trajectory

The copy, move, and execute events come up to the Connector through the Immunet Protect driver. Then the Connector passes this information off to the cloud servers to decide whether a file is malicious. Then the cloud server will load it into a database that Device Trajectory reads from. Therefore to troubleshoot what is going on:

1. Check if the driver is installed properly. If you run `fltmc instances` from the command line as an administrator, it will list the drivers installed and which drives it’s bound with. What you want to see is the ImmunetProtectDriver bound to all of the local hard drives (ie. C:\, E:\, etc.).

2. Check to see if the policy has Monitor File Copies and Moves and Monitor Process Execution enabled under Advanced Settings > File and Process Scan. Without these enabled, we will not monitor these file operations.

3. Check to see if you can connect to the cloud.

4. In your policy, set Advanced Settings > Administrative Features > Connector Log Level to Debug to make sure that you are getting disp=1 or disp=3 in your logs. A disp=4 means it failed to look up the file to the cloud. That could be an unsupported file type or other reason.

5. If you’re connected to the cloud and seeing the dispositions of 1 or 3 coming back from the cloud, then take a support diagnostic and attach it along with your external IP address to a support case.
Network events not in Device Trajectory

The network information is picked up by the DFC driver and sent to the AMP for Endpoints Connector. The Connector passes this information off to the cloud server to see whether or not that connection is malicious. In order to troubleshoot what is going on:

1. Check to see if the policy has Modes and Engines > Network set to Block or Audit.
2. Set the Advanced Settings > Administrative Features > Connector Log Level to Debug if you can see events that list the IP and port information.

IMPORTANT! AMP for Endpoints only monitors the first 100 connections after process execution. Therefore you need to make sure that you execute a new process after you start the AMP for Endpoints Connector. Internet Explorer will re-use processes for each new tab whereas Chrome will start a new process upon tab creation.

Policy not updating

When a Connector fails to receive policy updates the most common causes are network connectivity or proxy configuration. For network connectivity issues, see Proxy and Cannot connect to the cloud. If the proxy settings in the policy were mis-configured then most often you will have to uninstall the AMP for Endpoints Connector, reboot the computer, fix the proxy settings in the policy, download the AMP for Endpoints Connector installer again, then reinstall it. However, if you already have one computer installed in a group (you can move a computer into that group just for this purpose), then you can:

2. Find the policy you’re looking for and click on it (DO NOT click Edit) so that you see the preview on the right hand side and click the Download XML button. Once the XML file has been downloaded:
   - Stop the AMP for Endpoints Connector by typing `sfc.exe -k "password"` into a command prompt as an administrator from your AMP for Endpoints Connector install folder. You will only need to enter the password if you have Connector protection enabled and the password must be in quotes.
   - In the install folder (C:\Program Files\Sourcefire\FireAMP by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher), rename the existing policy.xml to policy.xml.bak
   - Copy the policy.xml that you downloaded to that folder and rename it policy.xml
   - Start the AMP for Endpoints Connector by running `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1), from a command prompt as an administrator.
• Open the policy.xml in the file you downloaded and note the serial number.
• Change something on the policy in the portal then click Sync Policy in the AMP for Endpoints Connector Settings screen. Wait approximately 2 minutes then check to see if the serial number has changed.

Proxy

Not every organization allows direct outbound connections to the Internet but instead routes connections through a proxy so that they can filter and scan traffic. AMP for Endpoints supports proxies, but it is important to make sure the policies are configured correctly. In this case, it’s probably best to start the AMP for Endpoints Connector with Advanced Settings > Administrative Features > Connector Log Level set to Debug in the policy. If there aren’t any obvious errors in the logs:

• Stop the AMP for Endpoints Connector by typing `sfc.exe -k “password”` into a command prompt as an administrator from your AMP for Endpoints Connector install folder. You will only need to enter the password if you have Connector protection enabled and the password must be in quotes.
• Close any unnecessary applications then install and run Wireshark on the computer you’re troubleshooting.
• Try to get a packet capture started between the proxy server and the outbound Internet connection using Wireshark.
• Make sure that the browser on your computer is configured with the same proxy configuration as the browser on the computer you’re troubleshooting. Test to make sure you can get to https://console.amp.cisco.com.
  • `CURL_APP = "curlpath\curl.exe"`
    Where curlpath is the path to your curl install directory.
  • `PROXY_SERVER = "http://x.x.x.x:yyyy"`
    Where x.x.x.x is the IP address of your proxy server and yyyy is the port used (normally 8080).
  • `PROXY_USER_PASS = "Domain\username:password"`
    Where Domain\username and password are the username and password you use to authenticate to the proxy server. If your proxy doesn’t require authentication you can leave this field empty.

Then you can run:
`cscript FireAMP_Helper.vbs testproxy`

• Start the AMP for Endpoints Connector by running `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1), from a command prompt as an administrator.
Troubleshooting
Duplicate Connectors

- Let the Connector run for approximately 5 minutes to generate traffic.
- Get an AMP for Endpoints diagnostics, the PCAP from the AMP for Endpoints Connector to the proxy, and the PCAP from the proxy to the Internet and attach them to a support case.

Duplicate Connectors

Under some circumstances you may see duplicate entries on the Computers page of the AMP for Endpoints Console. Determine the cause of the duplicate entries first, then you can proceed to delete them.

Causes

There are three common reasons for duplicate Connectors appearing in your Business.

Gold Standard Image

When you deploy endpoints using a gold standard image that includes the AMP for Endpoints Connector, each time you deploy an endpoint a duplicate Connector will appear in your AMP for Endpoints Console. If you deploy endpoints using a gold standard image, you can refer to this article or contact support for help on preventing duplicate Connectors.

Re-image

When you re-image an endpoint there will always be a duplicate Connector entry. This is because a new Device Trajectory is started for the re-imaged Connector and the old Connector Device Trajectory is maintained. If the computer was re-imaged because of a compromise this lets you further examine the possible cause. If you no longer need the old Device Trajectory the older Connector can be deleted.

Virtual Environments

Virtual environments can also cause duplicate Connector entries when new virtual sessions are started or when a virtual computer is re-imaged. In most cases you can refer to this article or contact support for help on preventing duplicate Connectors.

Delete Duplicate Connectors

Deleting duplicate connectors within the management console is a manual process. To manage duplicates, go to Management > Computers expand the Filters section at the top of the page, configure the Last Seen drop down to the desired range and click Apply Filter. The filtered view will show all connectors that were Last Seen over the time period selected. You can select all computers and delete them from the list. If you delete a computer that still has a Connector installed, it will re-register with the management console when the service is restarted such as on a reboot of the computer.
Simple Custom Detections

Simple Custom Detections allow you to manually blacklist files for detection. If **Modes and Engines > Files** is set to **Audit**, you'll just be notified of the detection but if it's set to **Quarantine**, the file will be quarantined. The most common issue is that you found a file, you copied it on your machine, you add it to a Simple Custom Detection, and then you can't understand why it's not being detected. There could be a few reasons:

1. The file is being excluded. Compare the path you’re running from with the path in your exclusions listed in the policy.xml. Don’t forget to look at file extension exclusions as well.

2. The file is in a signed Microsoft or Verisign Class 3 certificate. Right-click on the file and look at the properties. Check to see if there is a Digital Signature associated with it and who the issuer is. If it is Verisign and you’re sure it’s malware, upload it to Virus Total and then contact Support.

3. The file is not associated with the correct policy. Make sure the SHA-256 for the file is in the correct Simple Custom Detection list. Make sure that Simple Custom Detection list is associated with the policy that the Connector is using.

4. The file has been cached. This is by far the most common issue. When you copied it onto your computer, you created a record for it in your cache.db. To remove this:
   - Stop the AMP for Endpoints Connector by typing `sfc.exe -k "password"` into a command prompt as an administrator from your AMP for Endpoints Connector install folder. You will only need to enter the password if you have Connector protection enabled and the password must be in quotes.
   - Go to the install directory (C:\Program Files\Sourcefire\FireAMP by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and remove the cache.* files.
   - Start the AMP for Endpoints Connector by running `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1), from a command prompt as an administrator.
   - Now re-copy the file in question and make sure it is detected.

Custom Whitelists

The Custom Whitelist allows you to whitelist a file to avoid detection. This can be done as part of collecting all files from a “Golden Image” or in the case of a false positive. The most common issue here is caching because you had it previously on your computer and need to clear your cache.db:

1. Stop the AMP for Endpoints Connector by typing `sfc.exe -k “password”` into a command prompt as an administrator from your AMP for Endpoints Connector install folder. You will only need to enter the password if you have Connector protection enabled and the password must be in quotes.

2. Go to the install directory (C:\Program Files\Sourcefire\FireAMP by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and remove the cache.* files.
3. Start the AMP for Endpoints Connector by running `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1), from a command prompt as an administrator.

4. Now re-copy the file you created and make sure it’s not detected.

Another possible issue is that the Custom Whitelist is not associated with the correct policy or that the file SHA-256 is not on that list.

Application Blocking

Application Blocking allows you stop a file from executing without quarantining the file. If you add a SHA-256 to an Application Blocking list and it still executes, there could be a few reasons why this may occur:

1. The file is being excluded. Compare the path you’re running from with the path in your exclusions listed in the policy.xml. Don’t forget to look at file extension exclusions as well.

2. The file is not associated with the correct policy. Make sure the SHA-256 for the file is in the correct Simple Custom Detection list. Make sure that Simple Custom Detection list is associated with the policy that the Connector is using.

3. The file has been cached. This is by far the most common issue. When you copied it onto your computer, you created a record for it in your cache.db. To remove this:
   - Stop the AMP for Endpoints Connector by typing `sfc.exe -k "password"` into a command prompt as an administrator from your AMP for Endpoints Connector install folder. You will only need to enter the password if you have Connector protection enabled and the password must be in quotes.
   - Go to the install directory (C:\Program Files\Sourcefire\FireAMP by default for versions up to 5.1.1 and C:\Program Files\Cisco\AMP for versions 5.1.1 and higher) and remove the cache.* files.
   - Start the AMP for Endpoints Connector by running `net start immunetprotect` for versions up to 5.1.1 and `net start ciscoamp_[version]` where [version] is the Connector version installed (such as 5.1.1), from a command prompt as an administrator.
   - Now re-copy the file in question and make sure it does not execute.

Contacting Support

If you have not had success with other troubleshooting measures, you may need to contact Support to resolve your issue. In order to speed up turnaround time for your support case it is helpful to provide some information when opening the case.

1. Go to Management > Policies and edit the policy the AMP for Endpoints Connector you’re troubleshooting is in.

2. Set Advanced Settings > Administrative Features > Connector Log Level to Debug.
3. On the AMP for Endpoints Connector go to **Settings** and click **Sync Policy**. If you installed the Connector using the command line switch to disable the Start Menu items you can force a policy sync by opening a command prompt and entering:

```
%PROGRAMFILES%\Sourcefire\FireAMP\x.x.x\iptray.exe -f
```

Where x.x.x is the AMP for Endpoints Connector version number.

4. After the policy has synced allow the Connector to run for 5-10 minutes or perform the specific actions that are causing errors.

5. Open the Windows Start Menu and go to AMP for Endpoints Connector and click Support Diagnostic Tool. This will create a file on your desktop named `Sourcefire_Support_Tool_2013_XX_XX_XX_XX_XX.7z` where XX will represent the month, day, and time you ran the tool.

If you installed the Connector using the command line switch to disable the Start Menu items you can run the Support Diagnostic tool by opening a command prompt and entering:

```
%PROGRAMFILES%\Sourcefire\FireAMP\x.x.x\ipsupporttool.exe
```

Where x.x.x is the AMP for Endpoints Connector version number.

6. If you are having connectivity issues with the AMP for Endpoints Connector, take a PCAP of any network activity.

7. Upload the diagnostic file and PCAP to the Cisco SSL server at https://uploads.sourcefire.com/uploads/ed14f406d34f0fbd7c1af84fe024bd1d and make sure to note the filenames when contacting support.

8. If the issue is a user interface bug or a problem with the AMP for Endpoints Console, take a screenshot of the problem and attach it to the email you send.

9. **Contact Support** with all relevant information to the issue, the filenames of any files you uploaded, and attach your screenshots if required. Also make sure to include information on the type of proxy and firewall you are using in the case of connectivity issues.
AMP for Endpoints has unique network detection event types and Indications of Compromise. Descriptions of these detection types are found in this section.

**IMPORTANT!** For descriptions of threat names, see [AMP Naming Conventions](#).

### Indications of Compromise

AMP for Endpoints calculates devices with Indications of Compromise based on events observed over the last 7 days. Events such as malicious file detections, a parent file repeatedly downloading a malicious file (Potential Dropper Infection), or multiple parent files downloading malicious files (Multiple Infected Files) are all contributing factors. Indications of compromise include:

- **Threat Detected** - One or more malware detections were triggered on the computer.
- **Potential Dropper Infection** - Potential dropper infections indicate a single file is repeatedly attempting to download malware onto a computer.
- **Multiple Infected Files** - Multiple infected files indicate multiple files on a computer are attempting to download malware.
- **Executed Malware** - A known malware sample was executed on the computer. This can be more severe than a simple threat detection because the malware potentially executed its payload.
- **Suspected botnet connection** - The computer made outbound connections to a suspected botnet command and control system.
- **[Application] Compromise** - A suspicious portable executable file was downloaded and executed by the application named, for example Adobe Reader Compromise.
Threat Descriptions

DFC Detections

• [Application] launched a shell - The application named executed an unknown application, which in turn launched a command shell, for example Java launched a shell.

• Generic IOC - Suspicious behavior that indicates possible compromise of the computer.

• Suspicious download - Attempted download of an executable file from a suspicious URL. This does not necessarily mean that the URL or the file is malicious, or that the endpoint is definitely compromised. It indicates a need for further investigation into the context of the download and the downloading application to understand the exact nature of this operation.

• Suspicious Cscript Launch - Internet Explorer launched a Command Prompt, which executed cscript.exe (Windows Script Host). This sequence of events is generally indicative of a browser sandbox escape ultimately resulting in execution of a malicious Visual Basic script.

• Suspected ransomware - File names containing certain patterns associated with known ransomware were observed on the computer. For example, files named help_decrypt.<filename> were detected.

• Possible webshell - the IIS Worker Process (w3wp) launched another process such as powershell.exe. This could indicate that the computer was compromised and remote access has been granted to the attacker.

• Cognitive Threat - Cisco Cognitive Threat Analytics uses advanced algorithms, machine learning, and artificial intelligence to correlate network traffic generated by your users and network devices to identify command-and-control traffic, data exfiltration, and malicious applications. A Cognitive Threat Indication of Compromise event is generated when suspicious or anomalous traffic is detected in your organization. Only threats that CTA has assigned a severity of 7 or higher are sent to AMP for Endpoints.

IMPORTANT! In certain cases the activities of legitimate applications may trigger an Indication of Compromise. The legitimate application is not quarantined or blocked, but to prevent another Indication of Compromise being triggered on future use you can add the application to Application Control - Whitelisting.

DFC Detections

Device Flow Correlation (DFC) allows you to flag or block suspicious network activity. You can use Policies to specify AMP for Endpoints Connector behavior when a suspicious connection is detected and also whether the Connector should use addresses in the Cisco Intelligence Feed, custom IP lists you create, or a combination of both. DFC detections include:

• DFC.CustomIPList - The computer made a connection to an IP address you have defined in a DFC IP Black List.

• Infected.Bothost.LowRisk - The computer made a connection to an IP address thought to belong to a computer that is a known participant in a botnet.

• CnC.Host.MediumRisk - The computer made a connection to an IP address that was previously known to be used as a bot command and control channel. Check the Device Trajectory for this computer to see if any files were downloaded and subsequently executed from this host.
Threat Descriptions
DFC Detections

Appendix A

- ZeroAccess.CnC.HighRisk - The computer made a connection to a known
  ZeroAccess command and control channel.
- Zbot.P2PCnC.HighRisk - The computer made a connection to a known Zbot
  peer using its peer-to-peer command and control channel.
- Phishing.Hosted.MediumRisk - The computer made a connection to an IP
  address that may host a phishing site. Often, computers phishing sites also host
  many other websites and the connection may have been made to one of these
  other benign sites.

**IMPORTANT!** DFC is incompatible with applications that do network tunneling, like
VPN.
The following supporting documents are available for download.

**Cisco AMP for Endpoints User Guide**

The current version of the User Guide can be downloaded here.

Download the User Guide

**Cisco AMP for Endpoints Quick Start Guide**

This guide walks through setting up groups, policies, and exclusions then deploying AMP for Endpoints Connectors. This guide is useful for evaluating AMP for Endpoints.

Download the Quick Start Guide

**Cisco AMP for Endpoints Deployment Strategy Guide**

This guide provides a more detailed look at preparing and planning for a production deployment of AMP for Endpoints along with best practices and troubleshooting tips.

Download the Deployment Strategy Guide

**Cisco Endpoint IOC Attributes**

The Endpoint IOC Attributes document details IOC attributes supported by the Endpoint IOC scanner included in the AMP for Endpoints Connector. Sample IOC documents that can be uploaded to your AMP for Endpoints Console are also included.

Download the Endpoint IOC Attributes
Cisco AMP for Endpoints API Documentation

The API allows you to access your AMP for Endpoints data and events without logging into the Console. The documentation provides descriptions of available interfaces, parameters, and examples.
